Chosen App or Organization (semester project):Student Lost & Found App

Part 1. Planning Question Evaluation

New request being evaluated (one sentence):

We want to build a student Lost & Found App that can be used for students to post lost, search for lost items, and claim lost items that have been posted on campus.

1. Does this solve a real problem?

Yes. Students often lose personal belongings at school and may not know where to report or find them. Our app will provide one place where students can report lost items and check if their belongings have been found.

2. Do we already have something that can do this?

Not completely. Students may currently use group chats or social media to report lost items, but these methods are not organized. Our app will make the process more organized and easier to search.

3. Does this support the organization's actual goals?

Yes. Our app supports a safer and more organized school environment. It can also help students recover their belongings and improve communication between students and school staff.

4. Is it secure and cost-effective?

Yes. We can keep the app secure by requiring user accounts, limiting access to authorized users, and protecting personal information. Since the app has simple features, it can be developed and maintained at a reasonable cost.

5. Where would this rank against other approved work? (value, risk, dependency, or effort, reasoned in words, not calculated)

We would rank this as a high-value and medium-priority project. It solves a common student problem and is relatively simple to develop. It is also useful because it can save students time when looking for lost belongings.

Part 2. Security Pass Across the Four Domains

Domain	Security Concern	Matching Control
Business	Fake, inappropriate, or misleading lost-and-found posts may be submitted. Some users may also misuse the app to falsely claim items that do not belong to them.	Administrators will review reported posts and suspicious claims. Users can report inappropriate content, and administrators can remove posts or restrict accounts that violate the app's rules.
Data	Personal information such as names, contact details, account information, and item descriptions may be exposed to unauthorized users.	Personal information will only be accessible to authorized users. The system will apply proper access controls and protect stored data from unauthorized access or modification.
Application	Unauthorized users may access accounts or perform actions such as creating, editing, or claiming lost-and-found posts.	The application will require secure user authentication and passwords. Role-based access will also be used so that only authorized users can perform administrative functions.
Technology	The server, database, or application may become unavailable or vulnerable to attacks, outdated software, or data loss.	The system will use regular backups, software updates, secure configuration, and basic server security measures. Monitoring and recovery procedures will also be considered to reduce downtime and data loss.

One weak-link risk (how a weak point in one part could put a stronger part at risk):

If our **login security is weak**, an unauthorized person could access a user's account and view or change their information. This could put the other secure parts of our system at risk.

Part 3. Your First Repository Entry

Component being documented (application, data store, or technology platform): **Lost Item Reporting Module**

Field	Your Entry
What it does	It allows students to submit reports for items they have lost by entering details such as the item name, description, location, date, and uploading an image of the item.
Which department or user group uses it	Students use the module to report lost items. School staff or administrators may review and manage the submitted reports.

What it connects to	It connects to a user authentication system, lost item database, and image storage for storing uploaded item photos.
Who is responsible for it	Our project team is responsible for developing and maintaining the module, while the assigned school administrator is responsible for reviewing and managing submitted reports.
Whether it is still needed, and why	Yes, because students need a specific and organized way to report lost belongings. This module provides the information needed to help identify and locate lost items instead of relying only on group chats or social media.
